Spotted Website: Step-by-Step Manual

Goal: a 3D, scroll-story website at **spotted.ae** that looks like the Spotted reels. Restaurants and influencers can log in to see their own dashboards.

How: you won't write code. You copy prompts into **Claude Code on the web** (claude.ai/code). It runs in the cloud, so your laptop stays cool.

Part 0: What you need (one time)

These are the accounts you need. Use your Spotted email for every one of them.

Thing	What it does (like you're 5)	Where
GitHub	A box that keeps your website's files safe	github.com
Claude Code (web)	Your builder. You talk, it builds	claude.ai/code
Vercel	Puts your website on the internet	vercel.com (free plan)
Supabase	Keeps logins and numbers (sales, visits)	supabase.com (free plan)
Domain registrar	Sells you the name `spotted.ae`	Any UAE (.ae) registrar
Zoho Mail or **Google Workspace**	Gives you emails like `sarah@spotted.ae`	zoho.com/mail or workspace.google.com

Part 1: Get your name (domain)

1. Search for an **accredited .ae registrar** and type `spotted.ae` in the search box.
2. If it's taken, try `getspotted.ae`, `spottedapp.ae` or `spotted.app`.
3. Buy it for 1 year and turn on **auto-renew**, so you never lose it.
4. Keep the login for the registrar. You'll come back in Part 6.

> Tip: .ae names usually ask for a UAE trade licence or Emirates ID. Have one ready.

Part 2: Start the project in Claude Code

1. Go to **claude.ai/code**, sign in, and connect **GitHub** when it asks.
2. Click **New project** and name it `spotted-website`.
3. Paste this first prompt:

> Create a new Next.js website called spotted-website using TypeScript, Tailwind CSS and React Three Fiber (for 3D). Use the Poppins font (weights 500, 700, 800). Brand colours: purple #6A1FB0, deep purple #3C096C, red #E5383B, lilac #C9A2FF, yellow #FFD23F, white. Black only for text where needed. No people, faces or eyes in any visuals. Make the site work well on phones. Push it to my GitHub.

4. Wait until it says it's done. That's your empty website.

Part 3: The 3D story homepage (the reels look)

The homepage tells **one story as you scroll**, like watching a reel frame by frame.

It's the same street told three times:

Scene	What the visitor sees
Opening	Your **3D red bookmark with the pin**, floating over a purple road. Text: *"Saw it on a reel? Spot it for real."*
Journey 1: You	A phone plays a reel, and the bookmark pops onto it ("Saved"). The road moves forward, and a glowing dot walks past the café. A notification bubble says *"A place you saved is 1 km away."*
Journey 2: Restaurants	Lots of little purple bookmarks rain onto the café roof (people saving it). Rings pulse out (the offer is sent), and the windows light up (tables full).
Journey 3: Influencers	A reel card stands on the street. Bookmarks fly from the reel to the café. **Yellow stars** (saves) turn into **green stars** (visits).
Ending	*"Launching 1 January in the UAE"* with a **Join the waitlist** button

Reels vibe rules (tell Claude these every time you ask for changes):

- Big, bold Poppins 800 words that **pop in one at a time**, like reel captions.
- Fast, punchy cuts between scenes, not slow fades.
- Only the brand colours, with every scene using one main colour. Night-purple road, glowing pins.
- The text sits in a rounded caption box near the bottom, like Instagram captions.

Prompt to paste:

> Build the homepage as a scroll-driven 3D story with React Three Fiber and GSAP ScrollTrigger. The camera moves through one 3D street at night with a purple road. Scenes in order: (1) a 3D red bookmark with a location pin hanging from the top, floating over the road; (2) Journey 1 "You": a phone shows a reel, the bookmark pops onto it, then a glowing dot walks past "Café Luna" and a notification bubble says "A place you saved is 1 km away"; (3) Journey 2 "Restaurants": small purple bookmarks rain onto the café roof, offer rings pulse out, windows light up; (4) Journey 3 "Influencers": a reel card on the street, bookmarks fly from it to the café, yellow stars turn into green stars; (5) ending with "Launching 1 January in the UAE" and a waitlist email form. Style it like Instagram reels: Poppins 800 captions that pop in word by word, in a rounded caption box near the bottom, with fast punchy cuts between scenes. Only use the brand colours. No people or faces; use objects only. Keep the 3D light so it runs smoothly on phones, and show a simple non-3D version if the phone is slow.

Part 4: Buttons that stay on every page

Prompt to paste:

> Add a fixed "Log in" button in the top-right corner of every page. It opens a small menu with two choices: "I'm a restaurant" and "I'm an influencer". Add a round green WhatsApp button fixed in the bottom-right corner that opens https://wa.me/971508733160. Both must stay visible while scrolling and not cover the captions on phones.

Part 5: Logins and dashboards (the clever part)

5a. Connect Supabase (the memory box)

1. Make a free project at supabase.com and call it `spotted`.
2. Copy the **Project URL** and **anon key** from Settings, then API.
3. In Claude Code, paste:

> Connect Supabase for login and data. I'll paste my Project URL and anon key into the environment variables. Only restaurants and influencers can log in on the website (email + password, and "forgot password"). Normal users don't log in here; they use the app.

4. When Claude Code asks for the keys, paste them **into its environment variable box**, not into the chat text.

5b. Restaurant dashboard

This is what a restaurant sees after logging in:

- **Sales from Spotted this month** (AED), shown as a big number
- **Growth vs last month** (for example "+18%"), with a green or red arrow
- **Month-by-month chart** of sales and visits
- **Saves:** how many people saved the restaurant
- **Visits:** people who scanned Spotted at the counter
- **Best influencers:** who brought the most visitors
- **Offers:** create an offer, see who used it
- **Plan:** trial days left, or the AED 300/month subscription, or the AED 10 per visit trial

Prompt to paste:

> Make a restaurant dashboard page (only for logged-in restaurants). Show: this month's sales from Spotted in AED, growth % vs last month with an up/down arrow, a monthly chart of sales and visits for the last 12 months, total saves, total counter scans (visits), a ranked list of influencers who brought the most visits, an offers section to create offers and see how many were used, and their plan status (trial days left / AED 300 monthly / AED 10 per visit). Use the brand colours, glassy purple cards and Poppins. Create the Supabase tables needed, with security so each restaurant only sees its own data. Fill it with clearly labelled example data so I can see how it looks.

5c. Influencer dashboard

This is what an influencer sees after logging in:

- **Yellow stars:** people who saved a place from their reel
- **Green stars:** people who actually visited
- **Visits per restaurant:** a list showing which places they sent people to
- **Sales they brought** each month (AED), with growth %
- **Top reels:** the reels that made the most saves
- **Followers in Spotted**, and their plan status

Prompt to paste:

> Make an influencer dashboard page (only for logged-in influencers). Show: yellow stars (saves from their reels) and green stars (visits), a table of visits per restaurant, monthly sales they brought in AED with growth % vs last month, a 12-month chart, their top reels by saves, their Spotted followers, and plan status. Same look as the restaurant dashboard. Supabase security so each influencer only sees their own numbers. Use clearly labelled example data.

> Where the real numbers come from later: when a customer **scans Spotted at the counter**, the app saves that visit and the bill amount. The website just reads those numbers. Your Expo app and the website share the **same Supabase project**.

Part 6: Put it on the internet with your name

1. Go to **vercel.com**, click **Add New Project** and choose `spotted-website` from GitHub. Then click **Deploy**.
2. Add your Supabase keys in Vercel under **Settings, then Environment Variables**, and redeploy.
3. In Vercel, open **Settings, then Domains**, add `spotted.ae`, then add `www.spotted.ae` too.
4. Vercel shows you 1 or 2 **DNS records**.
5. Log in to your **domain registrar**, open **DNS settings** and copy those records in.
6. Wait from a few minutes up to 24 hours, then open spotted.ae. The padlock (HTTPS) turns on by itself.

Part 7: Your email (sarah@spotted.ae)

1. Sign up for **Zoho Mail** (it has a free plan) or **Google Workspace**.
2. Add the domain `spotted.ae`. It gives you **MX records**.
3. Paste those into the same DNS settings at your registrar.
4. Create `sarah@spotted.ae`, plus `hello@` and `partners@`.

Part 8: Before you tell anyone

Ask Claude Code:

> Check the site on a small phone, a big phone and a laptop. Make sure the 3D story is smooth, the captions don't hide behind the WhatsApp button, logins work, a restaurant can't see another restaurant's data, and the page loads fast. Add a page title, description and the Spotted icon as the favicon. Fix anything broken.

Then do these yourself:

- Open the site on **your own phone**.
- Log in as a test restaurant and a test influencer.
- Tap WhatsApp and check it opens the right chat.

Part 9: Changing things later

Just tell Claude Code in plain words, for example *"make the Journey 2 rain slower"* or *"add an Arabic version"*. It updates GitHub, and **Vercel puts the new version live by itself**.

Cheat sheet

Step	Where
Buy domain	.ae registrar
Build	claude.ai/code
Save files	GitHub
Logins + numbers	Supabase
Go live	Vercel
Connect name	Registrar's DNS settings
Email	Zoho / Google
